(a) under-estimated fade variance
held-out SLA (demand delivered)
solid: CV = 0.5
dashed: CV = 0.3
mean-case plan
chance-constrained, ε = 0.05
worst-case plan
fade variance under-estimate: true CV / planned CV
(b) dependence ignored by the planner
held-out SLA (demand delivered)
true inter-pass fade correlation ρ (planner assumes 0)
(c) how much of the saving survives
saving over worst-case
(worst-case / dependence-aware overhead)
CV = 0.3
CV = 0.5
CV = 0.9
solid: mean over all starting passes
dashed: Fig. 6 pass sequence
inter-pass fade correlation ρ (planner sizes with it)
(d) CV = 0.5, robust planners (legend below)
starting passes meeting SLA ≥ 0.95
true inter-pass fade correlation ρ
(d) assumes ρ = 0 (overhead 1.67)
(d) assumes ρ = 0.1 (overhead 1.75)
(d) assumes ρ = 0.2 (overhead 1.85)
(d) assumes ρ = 0.3 (overhead 1.94)
(d) assumes ρ = 0.5 (overhead 2.14)
(d) worst-case (overhead 2.64)
