(a) two districts (UC3's A and B)
held-out delivery ratio by deadline
SCG with the true model and with κ = 0
choose the same copies (curves coincide)
collapse correlation κ between coupled districts
(b) three districts, only A and B coupled
held-out delivery ratio by deadline
collapse correlation κ between coupled districts
(c) what correlation-aware replication buys
delivery gain of SCG over naive
(same copy budget)
2 districts, all coupled
3 districts, all coupled
4 districts, all coupled
3 districts, A-B coupled
4 districts, A-B coupled
collapse correlation κ
(d) over-confidence of the κ = 0 planner
predicted minus realised
delivery ratio
collapse correlation κ
epidemic (unbounded)
SCG, true dependence
SCG, assumes κ = 0
Bernoulli TEG, independent
naive, nominal-fastest
stale plan (1 copy)
